Blood Clotting Enzymology

Edited by **Walter H. Seegers**
Department of Physiology and Pharmacology
School of Medicine
Wayne State University, Detroit, Michigan

This is an introduction to the general field of blood clotting enzymology. The application of basic principles in clinical medicine is delineated in terms of platelet function, hemorrhagic diseases, thrombosis and physiological integration. The true course of the coagulation of the blood has been delineated, from its inception through clot retraction, and the neutralization of enzyme activity. This is a conservative treatment of the subject with a refreshing concentration on available facts. This realistic and critical analysis places the subject within the framework of modern concepts in enzymology, and the physiology of hemostasis.

CONTENTS:

Walter H. Seegers, Use and Regulation of the Blood Clotting Mechanisms
Charles R. Harmison and **Eberhard F. Mammen,** Molecular Characteristics of Substances Active in Blood Coagulation
Walter H. Seegers, Heinz Schröer, and **Ewa Marciniak,** Activation of Prothrombin
Birger Blombäck, Fibrinogen to Fibrin Transformation
Marion I. Barnhart, Immunochemistry
Leo Vroman, Surface Activity in Blood Coagulation
F. C. Monkhouse, Antithrombin
Eberhard F. Mammen, Plasma Anticoagulants or Inhibitors
Shirley A. Johnson, Platelets in Hemostasis
Eberhard F. Mammen, Irregular Blood Coagulation
Nils U. Bang, Ultrastructure of the Fibrin Clot
C. Martius, Chemistry and Function of Vitamin K
AUTHOR INDEX—SUBJECT INDEX.
